Trump's war on Iran: market impact

Day 60 of the US/Israel air-and-naval campaign against Iran. Ceasefire holds for a third week, but the Strait of Hormuz is still effectively closed and the US blockade of Iranian ports remains in force. Every delta below anchors on the Feb 27, 2026 close (last business day before the strikes began).

Energy: oil up, gas down, gold off-peak

The shock is concentrated in oil and refined products. Brent peaked at ~$138 (Apr 7 close) and is back at ~$114; gasoline lags but has already added more than $1.15/gal at the US pump. Henry Hub natural gas has actually fallen since the war began — it is a domestic North American market and the Hormuz disruption barely touches it. Gold spot is unusually negative on this clock because the Feb 27 baseline already included weeks of war-anticipation hedging; gold has sold off from that pre-war fear peak as the war moved toward stalemate.

Dollar & FX: a modest broad-USD bid, with painful exceptions

The USD broad index is up only 0.77%. The interesting story is below the surface: Asian and South African oil importers (USD/INR +3.5%, USD/THB +4.1%, USD/ZAR +3.6%, USD/JPY +2.1%) are paying the war's energy bill in a weaker currency, while net oil exporters' currencies (BRL +2.7%, IRR-adjacent ILS +5.0%) are stronger. Convention: positive Δ% (USD) means the dollar strengthened vs that currency.

USD/BRL	5.1369	4.9997	-2.67%	Real STRONGER — Brazil benefits as oil exporter
USD/ILS	3.1404	2.9834	-5.00%	Shekel STRONGER despite shooting war — markets price Iran weakening more than Israel risk
Iranian rial (IRR, free-market)	~720,000 / USD	~1,050,000 / USD	~+45%	No clean public daily feed; figures from Bonbast/news cites — directional only

Iranian rial caveat

Iran has had no realistic single official USD/IRR for years; the figure shown is the unofficial Tehran free-market rate (Bonbast / news cites). It moved from roughly 720,000 IRR/USD on Feb 27 to ~1.05M IRR/USD by late April. That's a ~31% loss of purchasing power against the dollar over 60 days. We deliberately do not put it on the chart because it is not from the same primary-source pipeline as everything else on this canvas.

Chinese yuan: the dog that didn't bark

A 60% Brent shock plus a 0.77% USD broad-index bid would normally pull the yuan weaker by 2-4%. It hasn't. Onshore CNY (FRED DEXCHUS) is at 6.836 vs 6.858 pre-war — actually **stronger** by 0.32%. Offshore CNH (TwelveData USD/CNH) is essentially flat at 6.846 vs 6.860, and the CNY-CNH gap is just ~10 pips — there is no speculative wedge. PBoC daily fixings have absorbed the entire shock; this is a managed float being managed.

6.8579
CNY pre-war (Feb 27)

6.8359
CNY latest (Apr 24)
-0.32%

6.8604
CNH pre-war (Feb 27)

6.8464

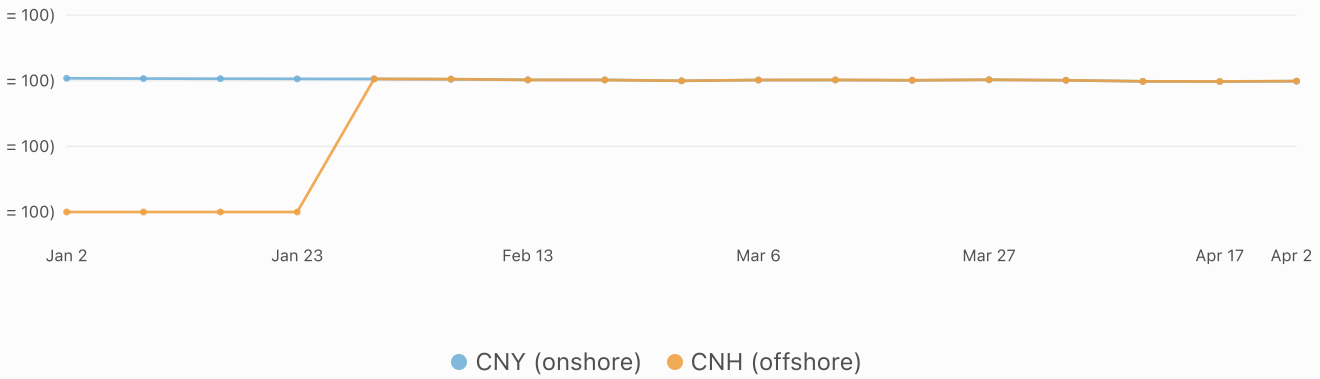
-0.20%



Read: when CNH trades materially weaker than CNY, the offshore market is testing PBoC's defense of the floor (last seen ~Aug 2023). When CNH trades right on top of CNY through a global energy shock, that is the PBoC telling you it has the firepower and the political will to absorb the move. Beijing is choosing to eat the import-cost inflation rather than let the yuan signal weakness. China has its own thesis on this war.

Agriculture & fertilizer: wheat the standout

Wheat is the main casualty here — it depends heavily on Black Sea / Russian / Indian export logistics that get disrupted by Hormuz spillover and elevated bunker fuel costs. Corn and soybeans are up modestly. Mixed fertilizer is barely up (+1.6%) on the official PPI, but that index lags by a month and the next print (May data, due June) is the one to watch. Agribusiness equities (MOO) are down -4.2%, reflecting margin compression from input-cost inflation rather than benefit from higher crop prices.

Series	Pre-war (Feb 27)	Latest	Δ%	Source
Wheat (IMF, USD/MT)	174.75	193.88	+10.9%	FRED PWHEAMTUSDM (monthly)
Wheat ETF (WEAT)	22.57	24.60	+9.0%	TwelveData (daily)
Maize/corn (IMF, USD/MT)	210.64	213.30	+1.3%	FRED PMAIZMTUSDM (monthly)
Corn ETF (CORN)	17.89	18.84	+5.3%	TwelveData (daily)
Soybeans (IMF, USD/MT)	409.48	426.60	+4.2%	FRED PSOYBUSDM (monthly)
Soybean ETF (SOYB)	23.82	24.76	+3.9%	TwelveData (daily)
US PPI mixed fertilizer	141.10	143.32	+1.6%	FRED WPU0652013A (monthly)
Agribusiness ETF (MOO)	85.59	81.97	-4.2%	TwelveData (daily)

Cadence caveat: the four FRED commodity series (PWHEAMTUSDM, PMAIZMTUSDM, PSOYBUSDM, WPU0652013A) are monthly. Latest observation date is March 1, 2026 — only one post-war print. Treat as directional, not settled.

Equities & risk assets

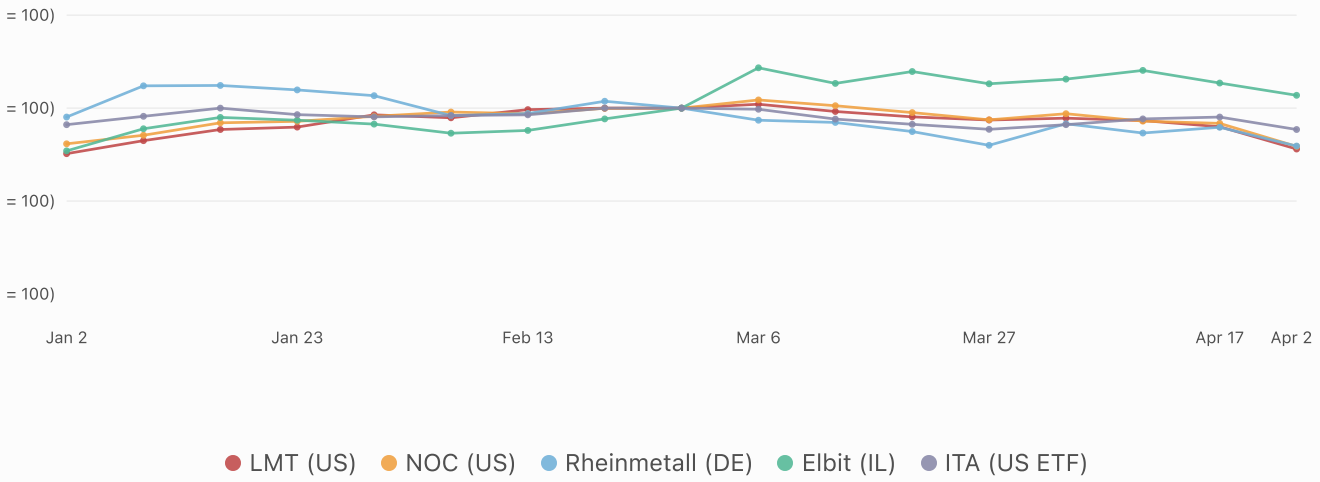
+3.78% S&P 500 (FRED SP500)	**+8.80%** NASDAQ Composite	**+0.33%** Dow Jones Industrial Average
+3.11% SPY (TwelveData)	**-1.56%** DIA (TwelveData)	**+14.69%** Bitcoin (BTC/USD)

The cap-weighted indices have been remarkably resilient — but the breadth is bad. NASDAQ-heavy mega-cap tech carries the S&P; Dow industrials (energy users, transports, materials) are flat to down. Bitcoin's +14.7% fits a digital-gold narrative; conventional gold's optical drop is a baseline artifact (see energy section). The composite read is mild stagflation: real economy inputs (oil, gasoline, wheat, EM FX) are stressed; financial assets levered to AI/tech are not.

Defense stocks: the war was already priced in

Conventional wisdom says shooting wars rip defense stocks higher. The data says the opposite — for this war, on this clock. The Feb 27 baseline already sat at multi-year highs after months of US/Israeli rhetoric and European rearmament repricing through 2025. From that peak, the actual war + a partial ceasefire was a sell-the-news event for almost every prime contractor on the planet. US primes are down 11-23%. European primes are down 6-21%, with Rheinmetall (the year's prior darling) leading the sector lower. The single counter-trend name is **Elbit Systems** — which gets actual emergency restocking orders from the IDF inside a 2-month war window — and even that is well off its early-March peak.

-22.5% LMT (Lockheed)	**-21.0%** NOC (Northrop)	**-21.2%** RNMBY (Rheinmetall)	**-12.6%** ITA (US def. ETF)
-14.7% RTX	**-17.4%** SAABY (Saab)	**+6.4%** ESLT (Elbit, Israel)	**-5.1%** GD (Gen Dynamics)



Ticker	Company	Country	Pre-war (Feb 27)	Latest	Δ%
ESLT	Elbit Systems	Israel (Tel Aviv / NASDAQ)	769.04	818.55	+6.44%

HII	Huntington Ingalls	United States	444.52	362.13	-18.53%
NOC	Northrop Grumman	United States	724.38	572.41	-20.98%
RNMBY	Rheinmetall (ADR)	Germany	394.79	311.20	-21.17%
LMT	Lockheed Martin	United States	658.08	509.81	-22.53%

Coverage gap (free-tier API limits)

Russian (Almaz-Antey, Tactical Missiles Corp), Chinese (AVIC, NORINCO), and Korean (Hanwha Aerospace, KAI) defense names are either unlisted, sanctioned, or unavailable on TwelveData's free tier. Mitsubishi Heavy is on a US pink-sheet (MHVYF) so liquidity is thin. The European primes are pulled via ADRs (RNMBY, FINMY, THLLY, BAESY, SAABY) because RHM.DE / LDO.MI / HO.PA / SAAB-B.ST require a paid TwelveData plan; ADR tracking error vs the home listing is small but non-zero.

War timeline (data context only)

Feb 27, 2026	Pre-war close. Brent $71.32, WTI $66.96, US retail gasoline $2.80/gal, S&P 500 6,879. Used as the baseline for every delta on this canvas.
Feb 28, 2026	Joint US/Israeli air-and-missile campaign on Iran begins; Iran begins mining the Strait of Hormuz.
Mar 3, 2026	Iran declares Strait of Hormuz closed; US announces naval blockade of Iranian ports.
Mar 27, 2026	Brent first closes above $120 (data: $121.47).
Apr 3, 2026	Reported peak: Brent ~$147 intraday (FRED close $138.21 on Apr 7); WTI close hits $138 area.
Apr 7, 2026	Trump announces a ceasefire after Kushner/Witkoff/Vance meet Iranian counterparts in Islamabad (21h, no deal). US blockade and Hormuz closure remain in effect.
Apr 17, 2026	Iran briefly reopens Hormuz tied to a separate Israel/Lebanon ceasefire; Trump says US blockade continues until a final deal.
Apr 18, 2026	Iran shuts Hormuz again ("breaches of trust").
Apr 21, 2026	Trump extends ceasefire pending an Iranian end-state proposal.
Apr 27, 2026	Iran tables proposal: mutual reopen of Hormuz, defer nuclear talks. CENTCOM: 38 ships stopped/turned by US blockade.
Apr 28, 2026	UAE announces it will quit OPEC. Trump publicly says he is unlikely to accept Iran's offer; Brent tops $112.
Apr 29, 2026	Today. Ceasefire holds, Hormuz remains effectively closed; US-Iran talks stalled.

Proved geological reserves: who has the long-term leverage

This section is structural, not strategic — it answers "who holds the world's oil and gas in the ground" but says nothing about who can actually weather a six-month supply shock today. For that, see the next section on strategic reserves and days of import cover. The reserves table is the structural reason this war moves Brent 60% on a six-week shock: six countries ringing the Strait of Hormuz — **Saudi Arabia, Iran, Iraq, UAE, Kuwait, Qatar** — together hold **~49% of world proved oil reserves** and ship roughly 20% of world crude through that single 39 km waterway. Add Iran's gas position

(1,200 Tcf, #2 globally) and Qatar's LNG (870 Tcf, #3) and Hormuz also gates ~20% of world LNG. This is not a tactical war over a target list; it is a war over the chokepoint to the global energy supply.

49%
Hormuz littoral states' share of world oil reserves

11.9%
Iran's share of world oil reserves (#3 globally)

16.5%
Iran's share of world gas reserves (#2 globally)

Top 15 countries — proved crude oil reserves (billion barrels, end-2023)

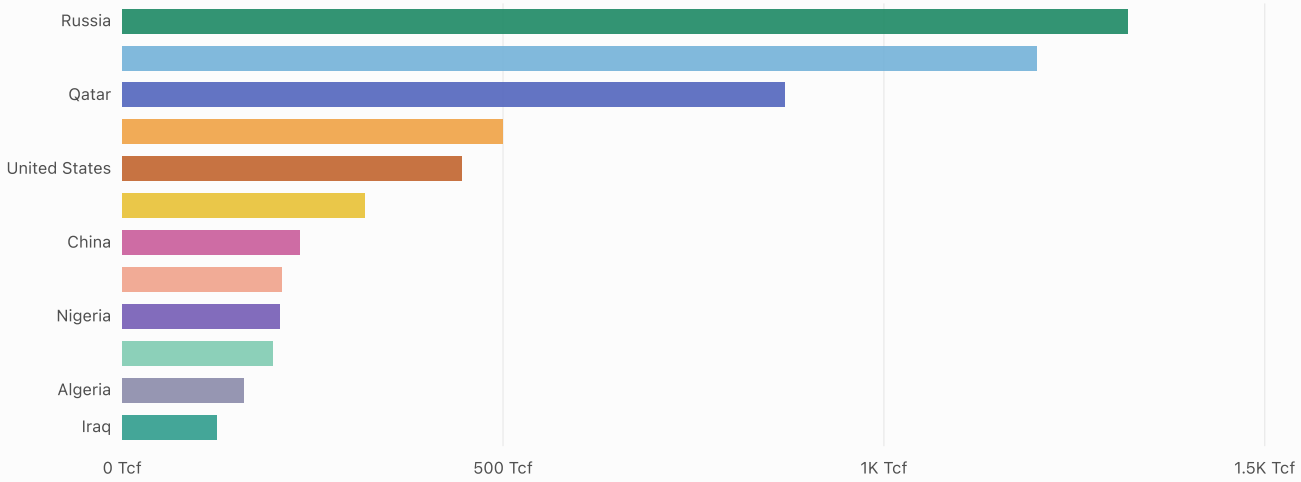
Top 12 countries — proved natural gas reserves (Tcf, end-2023)



Snapshot, not feed

Reserves are reported with a one-year lag and change ~1% annually. Values are end-2023 from the Energy Institute Statistical Review of World Energy 2024, cross-checked against OPEC ASB 2024 and EIA International Energy Statistics web tables. The EIA bulk download (`INTL.zip`, no key required) ships only coal-reserve series; crude-oil and dry-gas reserves require the EIA v2 API key. We saved a JSON snapshot at `data/raw/eia_reserves_snapshot/2026-04-29.json` for provenance. Venezuela's 303 Bbbl reflects officially reported "proved" reserves including extra-

heavy Orinoco belt crude that requires upgrading to be competitive at scale — the practical export-grade reserve is much smaller, which is why Saudi Arabia is the world's #1 in operating terms despite being #2 on this paper ranking.

Strategic reserves & days of import cover: who can ride this out

Proved reserves measure the oil that's still in the ground; strategic reserves measure the oil you can actually deliver to a refinery tomorrow. IEA member countries are obligated to hold at least **90 days of net-import cover** in emergency stocks (public + industry + bilateral). On **March 11, 2026**, IEA members agreed to a coordinated release of 400 Mbbl — the largest in the agency's history. The bar chart below shows where each major economy actually stands; the line chart shows what the war has done to the world's largest single stockpile, the US Strategic Petroleum Reserve.

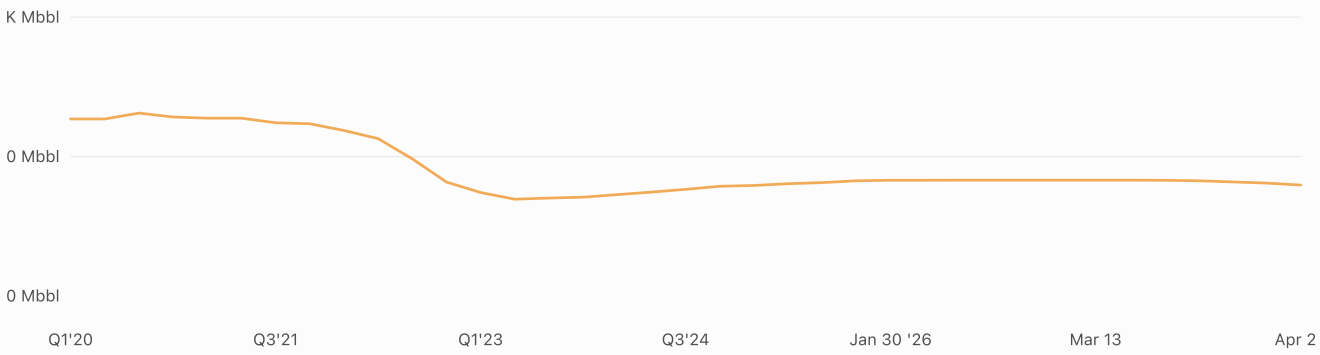
397.9
US SPR latest (Mbbl, Apr 24)

-17.5 Mbbl
Δ since Feb 27 war start (-4.22%)

-2.2 Mbbl/wk
Avg weekly draw, Mar 27 → Apr 24

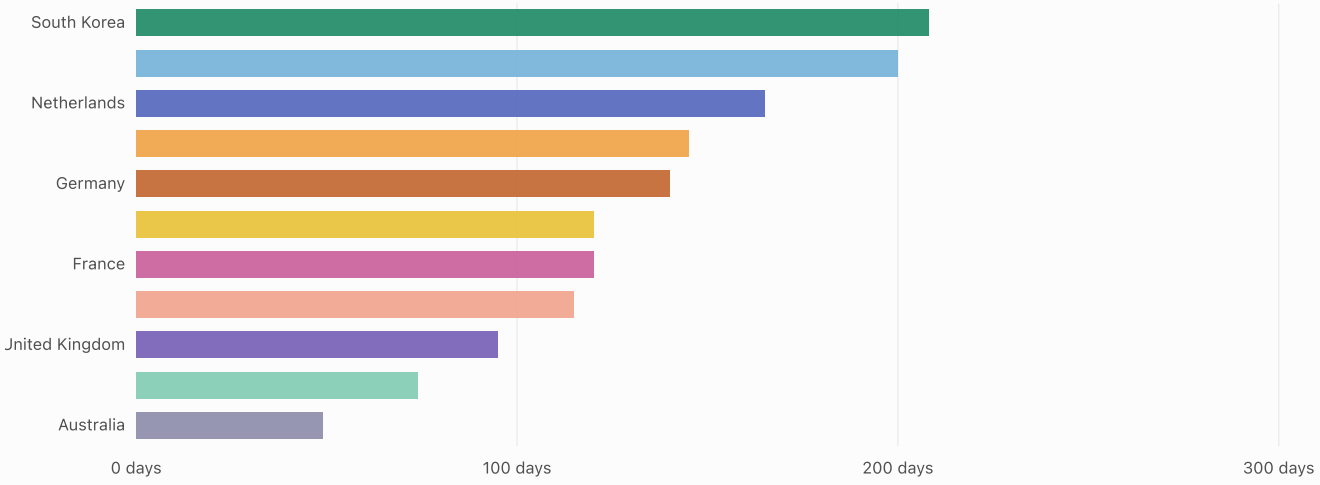
400 Mbbl
IEA coordinated release authorized Mar 11

US Strategic Petroleum Reserve: from Biden drawdown to Trump war draw



The 2022 Biden drawdown took the SPR from ~594 to ~372 Mbbl (a 220 Mbbl release over the year). A slow refill followed through 2023-2025, returning the SPR to ~415 Mbbl just before the war. The post-war draw is small in absolute terms (~17.5 Mbbl, four weeks at ~$120 Brent) but it is the fastest weekly pace since 2022, and unlike 2022 the buyer of last resort is not yet active in the market.

Days of net-import oil cover, by country



90-day line: the IEA minimum obligation. Net oil exporters (US, Saudi Arabia, Russia, Brazil, UAE, Iran) are excluded from this chart — the metric is undefined for them — but appear in the table below with their on-land stocks.

Country	Days of cover	Total stocks (Mbbl)	IEA member	Net importer	As of	Notes
South Korea	208 days	79.0	Yes	Yes	2026-01	
Japan	200 days	263.0	Yes	Yes	2026-01	
Netherlands	165 days	—	Yes	Yes	2026-01	Logistical hub; high stocks per net imports
Spain	145 days	—	Yes	Yes	2026-01	
Germany	140 days	—	Yes	Yes	2026-01	
China	120 days	1390.0	—	Yes	2026-03	Estimated; SPR holdings undisclosed. Combined SPR + commercial.
France	120 days	—	Yes	Yes	2026-01	

Country	Days of cover	Total stocks (Mbbl)	IEA member	Net importer	As of	Notes
Italy	115 days	—	Yes	Yes	2026-01	
United Kingdom	95 days	—	Yes	Yes	2026-01	
India	74 days	25.0	—	Yes	2026-03	SPR alone is ~9.5 days at full capacity (currently 64% full = ~6 days). Total petroleum cover incl. commercial OMC stocks ~74 days. Below 90-day IEA benchmark.
Australia	49 days	—	Yes	Yes	2026-01	Below 90-day IEA obligation; in breach since 2012.
United States	n/a	397.9	Yes	Net exporter	2026-04-24	Net exporter since 2020; IEA days metric n/a. SPR shown for context (415.4 Mbbl on Feb 27 → 397.9 Mbbl on Apr 24, a 17.5 Mbbl drawdown over 8 weeks).
Saudi Arabia	n/a	82.0	—	Net exporter	2026-04	Net exporter; on-land oil (excludes leased storage in JP/KR).
Iran	n/a	71.0	—	Net exporter	2026-04	Net exporter (sanctioned); on-land oil only.
UAE	n/a	34.0	—	Net exporter	2026-04	Net exporter; excludes Fujairah underground + leased storage abroad.
Brazil	n/a	—	—	Net exporter	2026-01	Net exporter; no formal SPR. Commercial industry stocks ~30 days.

Country	Days of cover	Total stocks (Mbbl)	IEA member	Net importer	As of	Notes
Russia	n/a	—	—	Net exporter	2026-01	Net exporter.

The OECD blanket: ~90 days minimum, by treaty. Every IEA member but Australia clears the 90-day bar, and most clear it by a wide margin. Japan and South Korea — both ~100% import-dependent and both gated through the same Hormuz/Malacca corridor — sit at 200 and 208 days respectively. European IEA members cluster between 95 and 165 days. This is the single biggest reason the developed world has not panicked at $114 Brent: the buffer is real and it is not being touched yet.

The wildcards: China opaque, India exposed. China sits outside the IEA system; its strategic petroleum reserve is undisclosed but US EIA and Columbia CGEP both peg the combined SPR + commercial stockpile at ~1.39 Bbbl, equivalent to roughly 120 days of net imports at ~11.5 Mbpd. That is a strategic asset on a different scale than anyone else's. India is the cautionary tale on the other side: ISPRL's caverns are 64% full, holding 3.37 MMT of crude — about **6 days of strategic cover** at current consumption. Total petroleum cover including commercial OMC stocks is ~74 days, still below the IEA's 90-day benchmark, with 88% of crude imported and a third of that historically transiting Hormuz. India's Phase II (6.5 MMT additional) was approved in 2021; nothing has come online.

What the war has actually cost: 17.5 Mbbl off the US SPR in 8 weeks. The SPR sat flat at 415.4 Mbbl through the first month of the war (Feb 27 → Mar 20), then drew at an average pace of 2.2 Mbbl/wk for four straight weeks (Mar 27 through Apr 24). At that pace, full depletion would take ~3.5 years — but the relevant question is the ceasefire, not exhaustion. If the war reignites and Hormuz stays closed, you would expect (a) the IEA's authorized 400 Mbbl release to start hitting tape (it has not yet), (b) a parallel China stockdraw if Iranian flows stay cut, and (c) European industry stocks (~600 Mbbl OECD-aggregate) to start visibly drawing. None of those are happening yet at scale. The strategic-reserves layer is the reason Brent is at $114 and not $200.

Snapshot, not feed

The US SPR weekly time series is hand-transcribed from the EIA Weekly Petroleum Status Report (*data/raw/eia_spr_snapshot/2026-04-29.json*). FRED does not host the EIA WPSR series IDs (*WCSSTUS1, WCESTUS1, WTTSTUS1* all return HTTP 400 against the FRED API — confirmed at pull time). The cross-country days-of-cover figures come from the IEA Oil Stocks of IEA Countries data tool plus government filings for non-IEA countries (China, India), saved as *data/raw/iea_emergency_stocks_snapshot/2026-04-29.json*. A live EIA WPSR connector and a live IEA emergency-stocks connector are both parked on the DataHoover backlog.

Methodology & sources

Pre-war anchor: last available close on or before 2026-02-27. Latest: most recent observation in the warehouse as of 2026-04-29 23:50 UTC. FRED daily series can lag one business day relative to TwelveData. All "Δ% (USD)" values use the convention that a positive number means the dollar strengthened vs that currency. "Spot gold" and ETFs (USO, BNO, UNG, GLD, WEAT, CORN, SOYB, MOO, UUP, BTC/USD, USD/ILS) come from TwelveData; everything else from FRED.

Primary feeds: FRED series DCOILBRENTEU, DCOILWTICO, DHHNGSP, GASREGCOVW, DTWEXBGS, DTWEXAFEGS, DTWEXEMEGS, DEXUSEU, DEXUSUK, DEXUSAL, DEXJPUS, DEXMXUS, DEXBZUS, DEXINUS, DEXCHUS, DEXKOUS, DEXSDUS, DEXSFUS, DEXTHUS, DEXSIUS, DEXTAUS, SP500, DJIA, NASDAQCOM, PWHEAMTUSDM, PMAIZMTUSDM, PSOYBUSDM, WPU0652013A. TwelveData symbols: GLD, USO, BNO, UNG, WEAT, CORN, SOYB, MOO, UUP, XAU/USD, BTC/USD, USD/ILS, USD/CNH, SPY, QQQ, DIA, IWM, plus defense names LMT, RTX, NOC, GD, LHX, HII, ITA, BAESY, SAABY, RNMBY, FINMY, THLLY, ESLT, MHVYF.

Proved reserves snapshot: Energy Institute Statistical Review of World Energy 2024 (end-2023 vintage), cross-checked against OPEC ASB 2024 and EIA International Energy Statistics. Saved as *data/raw/eia_reserves_snapshot/2026-04-29.json* for provenance. Reserves change ~1% per year and are not pulled live; treat the table as structural context, not a market quote.

Strategic reserves: US SPR weekly stocks from EIA WPSR / WCSSTUS1, hand-transcribed to *data/raw/eia_spr_snapshot/2026-04-29.json* (FRED returns HTTP 400 for the WPSR series IDs). Cross-country days-of-cover from IEA Oil Stocks of IEA Countries data tool (Jan 2026 reporting month) plus government filings for non-IEA China and India, saved as *data/raw/iea_emergency_stocks_snapshot/2026-04-29.json*. Live EIA WPSR and IEA emergency-stocks connectors are parked on the DataHoover backlog.

Iranian rial figures from Bonbast / Reuters / AP free-market reporting (no clean primary feed exists). War timeline cross-checked against CNN, CBS News, CNBC, Bloomberg live blogs as of Apr 28-29, 2026.

Data warehouse: data/warehouse.duckdb (DataHoover). Raw JSON snapshots in data/raw/<source>/.
